Oryx Centre for Strategic Futures

Auditable research, verified claim by claim

Research produced from scratch — and checked before it is delivered.

Amartya Kumar, Founder | Noida, India | oryxai.in

Can you trust the research your AI wrote?

The problem: AI research cannot be checked

AI-generated research is already used for decisions — but nobody can tell which claims in it hold up.

We measured it: across 30 AI-generated briefs and 194 citations, 95 citations were broken (49%) and only 50 verified (26%).

The cost of acting on a broken citation falls on the decision-maker, not on the tool that wrote it.

Why now: AI writing is now the default for briefs, research and policy drafts — the checking gap grows with every document.

Stage: MVP live since 4 November 2026; problem–solution fit being tested through free checks and pilot outreach.

The solution: the method, not the model

AI tools generate research. Oryx verifies it — claim by claim, against sources a reader can open.

The method is published in full and reproducible: working paper DOI 10.5281/zenodo.23718472, Paper 2 DOI 10.5281/zenodo.23731235.

Innovation is not 'AI that writes'. It is research that can be checked — and that check is the product.

Innovation criterion: a service new to the Netherlands — no Dutch provider offers a claim-by-claim audit of AI-generated research briefings, checked against the Dutch market.

This point runs through the whole deck: innovation is auditable research.

The MVP: live, invite-only, human-gated

Oryx AI beta: an auditable research agent producing a report from a brief, with every claim verified.

How it works: brief in, report out, every material claim checked against its source, then human review before delivery.

Human gate: co-founder Riya Nalwa reviews every delivery (3–5 working days) until a review team is hired.

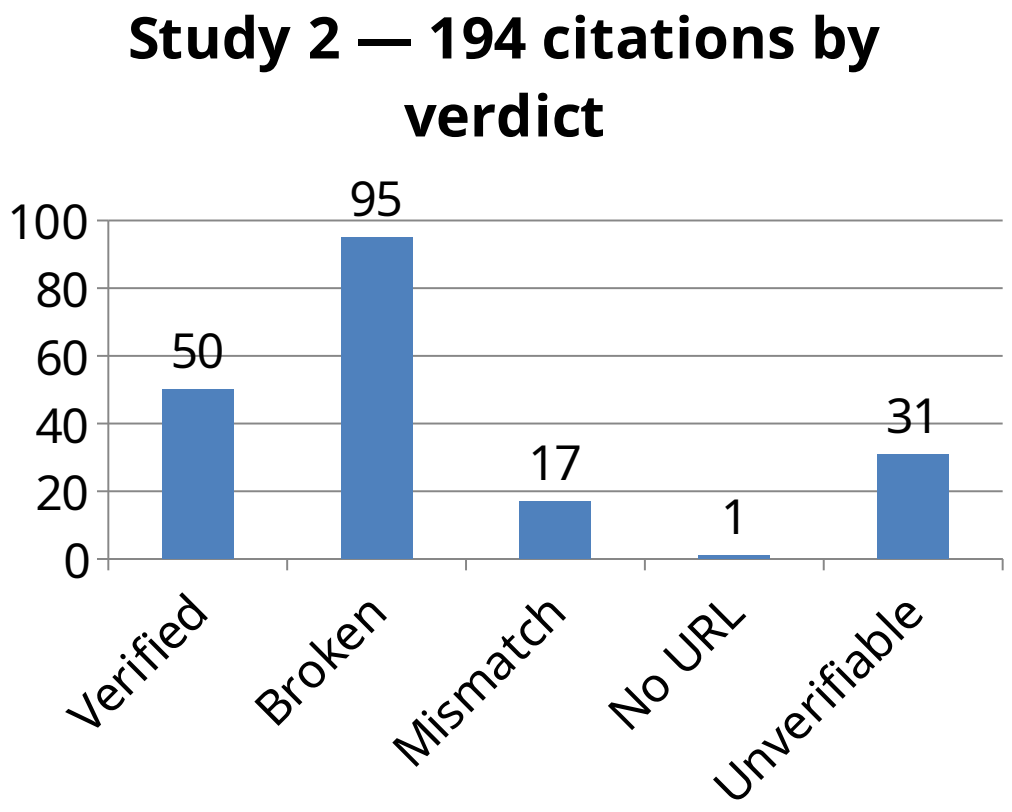

Proof so far: a published sample report (oryxai.in/oryx-ai-beta-report-31oct.html, labelled sample, not a pilot sale) and test runs with all sources verified.

Why a client buys: cheaper than an in-house team, less decision risk, no re-checking — for research and policy teams that must defend their briefings.

Traction: measured, not asserted

Published evidence: a 194-citation audit in two published papers — the chart shows the audit's verdicts.

First paid pilot offered at ₹7,500 in India / $150 abroad, payable only on acceptance — with a free five-citation check anyone can try first.

The first year: status and market entry

Status now: Oryx AI beta live since 4 November 2026; free five-citation check live; pilot outreach in progress.

How customers come in: warm outreach → free five-citation check → paid pilot → full research, retained by payable-on-acceptance terms.

13–15 November: Apart Research sprint, online. Next milestone after it: the first paid pilot.

Dutch entry: through the facilitator’s network and Dutch universities and institutes, from a base in Leeuwarden, Friesland.

Business model: paid on acceptance

Pilot: an evidence audit at ₹7,500 in India / $150 abroad, payable only if the client accepts the delivery.

Full research: per-project quote after a written scope, on the same payable-on-acceptance terms — no fixed price invented.

The wedge is free: five citations from a published brief checked free, spot checks unlimited, each reviewed by our co-founder.

Who pays, and why it scales: research, policy and consulting teams that need research they can defend — the agent carries the volume, so growth means hiring reviewers.

Market: everyone who decides on AI-written research

AI-generated research is now used across research, policy, consulting, legal and media work — every one of those decisions rests on claims nobody verifies.

In the Dutch ecosystem alone: 14 research universities, plus the institutes and companies around them, all use AI-generated research — and none can currently verify it claim by claim.

The pain is measured, not assumed: 49% of citations in our audit were broken, 26% verified.

The market grows with AI writing itself: every new AI-written brief is another document that needs checking.

Competition: no direct equivalent

Provider	Claim-by-claim audit	Writes the research too
Oryx	**Yes**	**Yes**
ICT Institute	No	No
TNO generative-AI evaluation toolkit	No	No
Bureau Veritas	No	No
SGS Netherlands' AI Trust Check	No	No
In-house team	Yes, slowly	Yes
Unchecked AI output	No	Yes

Only Oryx does both — and only Oryx is paid on acceptance.

Why the Netherlands should choose Oryx

A startup whose innovation is measured, not asserted — 194 citations, published, reproducible.

Research-integrity capacity for the Dutch AI ecosystem: universities, institutes and companies all use AI-generated research, and none can currently verify it claim by claim.

A Global South bridge: Oryx works on AI, geopolitics and emerging technology for Global South decision-makers, from a base inside Europe’s research and policy networks.

A team that builds in public: methods published, audit figures open, human review before every delivery.

Why Oryx chose the Netherlands

A clear, official route for an innovative startup: the startup visa, with a recognised facilitator.

An innovation test that fits what Oryx actually has: a measured, published method, not just an idea.

A base in Friesland: we will locate the startup in Leeuwarden, among the university-linked incubators and AI and data campuses this work needs.

We came to Inqubator after a conversation with RVO NLentry; your second look at our application is why this deck is in front of you.

Facilitators RVO pointed us to — and why Inqubator

Brightlands Smart Services Campus — AI and data campus, closest fit to research verification; its facilitation programme is paused for the rest of 2026.

DutchBasecamp — helps foreign founders land in the Netherlands, including regulated-sector work and EU compliance.

Capital C Amsterdam — Startup Visa Program, recommended by RVO at the 3 November meeting.

Why Inqubator: a facilitator that judges the work, with business development, mentoring and university partnerships in Friesland — and the one that took a second look.

The team

Amartya Kumar, Founder — B.A. Political Science and Geography, Savitribai Phule Pune University, First Class with Distinction; Business Development Associate at BYJU'S, Delhi, 2022–2024, at 120–150% of target, Top Performer; freelance research and operations since 2024; founder of Oryx since 2 October 2026. He leads research and product, and outreach.

Riya Nalwa, Co-founder — M.Sc. Biotechnology, Sharda University, Gold Medalist; human review gate for every Oryx delivery.

Advisors and part-time reviewers to be appointed as the team grows.

Financials: the money homework is done

Means of support: €21,201.24 per founder for 12 months (IND norm from 1 July 2026), to be held in a Dutch bank account.

IND fee: €423 per founder on application; decision within 90 days.

Facilitator fee: €800 per month excl. VAT × 12, starting only once the residence permit card is issued — then €150 per month as a member.

Income plan, not a forecast: paid pilots at ₹7,500 in India / $150 abroad, payable only on acceptance. No funding is asked for in this deck.

What we ask of Inqubator

Your view on fit: whether Oryx fits your programme, and what you would need to see next.

A call to discuss it, at one of the times you offered.

The sequence for two founders applying individually — and the dated step-by-step plan for year one, built with you next, if you decide to act as our facilitator.

No funding is asked for. We ask for a facilitator decision, the next step — and introductions to Dutch research teams who could try the free check first.

Entity form is open: any legal form works if the founder owns at least 25% and is registered as founder, per RVO guidance.
